(Yesterday, I wasn't able to publish the article. "Success in fault")

Already yesterday's thing.

Immediately before I was trying to update our completely renewed Home page for Corona Corruption, my PC suddenly became so slow that it became useless. Immediately before that, there was a major OS (operating system) program update, and almost at the same time, Bios (Basic input-output system) from the PC manufacturer side was the most important PC that bridges the hardware of the PC and the OS. There was also an update with an emergency announcement (which is the core part that corresponds to the cornerstone layer).

I ran into a bug without doing anything special, so I first suspected an OS bug, but I couldn't find the corresponding update build number in the bug report on my PC. Then, when I told the PC manufacturer about the symptoms, he said, "Even if you say it is urgent, you should not do it unless there is a problem in the current situation." "What? What should I have not done?" "If so, it should be written that there is no need to install if there is no problem under the current situation." Since I'm talking, why don't I tell my boss that the customer was saying that, not you?

Then, when I made a proposal, I answered "So, I do" in Japanese, which is somewhat repulsive. Then, when I asked a programmer I knew from me to check this manufacturer's bug report, it was said that it was quite good, so I interpreted it as the cause of the PC maker rather than the OS side. (It's like having a poison in the vaccine you inject.)

However, I can't wait for "Poison-less" program to come out. There is no choice but to find a way to avoid the bug. Anyway, if you miss the HP renewal timing, it will be a wedding cake delivered to you after the wedding.

Then I tried and worked around it for 14 hours, but it didn't work. So, "I can't help but ask for something that doesn't exist. I'll shake my eyes and change my viewpoint." The first thing I thought about was "Can I give up on this PC and do something else?" Let's use something.

"

Then, when I checked the handheld further, it is certainly slower than the current PC, but the old PC works for the time being. Also, just in case, I came up with the idea of transferred the original data of the PC to a different cloud drive from the one I am using now.

And again, I worked on it for 9 hours (I tried uploading speed is too slow and I can not transfer to an external hard disk, but this is also slow, so if you consider later usability, And then I joined it earlier this morning and it worked. The modification program is different for each model generation.

Because it was.

During that time, how many times did you yell and smash something? However, what helped me was that I had some knowledge of IT because I could not throw the IT related business to the contractor from the beginning and I had to do it myself. At that time, it was far better to depend on IT engineer in terms of efficiency, but at the moment, it was much better to not depend on it in circles effectively.

What's more, I also found a new cloud drive that was markedly upgraded. It was the end of yesterday, which is now the "success in fault".
